

DAY # 8 OS

① we use action(form) in order to link our code to backend.

② * input type = "text" ⇒ for writing name or anything

* input type = "email" ⇒ for mail

↓
name = "myEmail" ⇒ represent ~~how~~ with what name it will reach backend.

* input type = "date", "submit", "button"

* input type = "checkbox"

* input type = "reset"

* textarea = for writing something

* label for = "name" Name;

if its equal to input type = "text"
like id, then it ✓

* <select name "myCar" id = "car">

<option value = "ind" > indica >

<option value = "bus" > bus > selected

by default it selected.

Elements in form

<input>

Attributes.

type = "text" \Leftrightarrow pre defined
name = "firstname" \leftarrow user defined

<input type="text" name="name">
value = "male"

- ①. <input type="text">
 - ②. <input type="password">
 - ③. <input type="radio"> (options)
 - ④. <input type="checkbox">
 - ⑤. <input type="file">
 - ⑥. <input type="submit">
 - ⑦. <input type="reset">
 - ⑧. <input type="image">
 - ⑨. <input type="data">
- In radio, name should be same

Text area

<textarea cols="40" rows="4">

select tag

<select>

<option value="LHR">LHR</option>

</select>

fieldset → makes the entire content in box
legend → makes the text written in
the line in fieldset.

- W3school input types

* select

<p> Card type:

<select name="card type" id="card-type">

<option value=" " -- Select card type </option>
</select>

</p>

If you want to make writing anything
compulsory. use attribute :-
required.
